1.3964 displays non magnetic properties due to its high alloy content. This high alloy content also results in high tensile and yield strengths coupled with very good resistance against corrosion, especially in seawater and coastal environments.

**Special properties**
- non-magnetic grade ($\mu_r \leq 1.04$)
- forgeability average
- weldability good
- non-magnetic (µr 1.04)

**Physical properties**
- density (kg/dm³) 7.90
- electrical resistivity at 20 °C (Ω mm²/m) 0.70
- magnetizability no
- thermal conductivity at 20 °C (W/m K) 460
- specific heat capacity at 20 °C (J/kg K) 14
- thermal expansion (K⁻¹) 20 – 100 °C: 15.7 x 10⁻⁶
  20 – 200 °C: 17.0 x 10⁻⁶
  20 – 300 °C: 17.5 x 10⁻⁶
  20 – 400 °C: 17.8 x 10⁻⁶

**Typical applications**
- non-magnetic components
- ship building industry

Note: alternative materials 1.3952 and 1.3974

**Processing properties**
- automated machining no
- machinable yes
- hammer and die forging yes
- cold forming in some instances
- cold heading in some instances

**Conditions**
- solution annealed and quenched

**Demand tendency**
- constant

**Corrosion resistance**
- 1.3964 displays excellent resistance against corrosion in rural, industrial and coastal environments, and can be used in the food and beverage industry, provided the acid concentrations are not too high. 1.3964 finds use in cold nitric and organic acid solutions, as well as in chloride containing environments. Since this grade of stainless steel is still resistant to intergranular corrosion after welding, i.e. in the sensitised condition, corrosion testing in accordance with the following corrosion testing specifications is thus sufficient to establish resistance to corrosion:
  - AFNOR NF 05-159 – ASTM A262-75. Practice E – DIN 50914

*Please note that the presence of large amounts of manganese could adversely affect the pitting corrosion resistance. This means that although this steel is resistant to corrosion in sea water, it will be less resistant to pitting corrosion than an equivalently alloyed, low manganese steel.*
Heat treatment and mechanical properties

Optimal physical and fabrication properties are realised after solution annealing in the temperature range 1020 °C – 1050 °C followed by rapid cooling in air or water. In the solution annealed condition, the following mechanical properties may be attained when testing in the longitudinal direction:

<table>
<thead>
<tr>
<th>Property</th>
<th>Specification</th>
<th>Typical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yield strength (N/mm²)</td>
<td>Rp0.2</td>
<td>≥ 365</td>
</tr>
<tr>
<td>Tensile strength (N/mm²)</td>
<td>Rm</td>
<td>700 – 950</td>
</tr>
<tr>
<td>Tensile elongation (%)</td>
<td>A5</td>
<td>≥ 35</td>
</tr>
<tr>
<td>Impact energy (J) at 25 °C</td>
<td>ISO-V</td>
<td>≥ 85</td>
</tr>
</tbody>
</table>

The mechanical properties (d ≥ 160 mm) have to be agreed on for thicker dimensions, or the delivered product is based on the values given.

Magnetic permeability

The low magnetic permeability of AMANOX® 3964 stems from its austenitic microstructure.

Welding

As a result of the low carbon content of 1.3964, welding will not result in the formation of chromium carbides. Should a filler material be required, then the grades 1.3954 and 1.3984 can be used. Should heat treatment after welding be unavoidable, due to extensive cold deformation or due to high wall thickness, then the aforementioned heat treatment may be undertaken.

Forging

When forging 1.3964, the work pieces are usually pre-heated to between 950 °C – 1150 °C with forging taking place between 900 °C and 1100 °C. After forging, the forged component must be rapidly cooled in either air or water to avoid the formation of any undesirable phases which might adversely affect the corrosion and/or mechanical properties.

Machining

As a result of its high alloying addition, 1.3964 is difficult to machine. The following machining parameters can be used as a guideline when machining 1.3964 using coated hard metal cutting tools.

<table>
